HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

AMENDMENT/ALLOWANCE

Response to Arguments

1. Applicant's arguments, see Remarks (filed on July 21, 2010) page 11 fourth paragraph and bottom paragraph for claims 37 and 39-44 regarding U.S.C. 112 and U.S.C. 101 rejections, have been fully considered and are persuasive. The cancellation of claims 1-30, 33, 34, 38, and 44 is acknowledged and the rejection of claims 37 and 39-44 has been withdrawn.

Examiner's Amendment

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Jonathan Berschadsky (registration number 46,551) on July 22, 2010.

The application has been amended as follows:

In claim 42:

42. A control method for the moving image decoding apparatus which decodes moving image data coded by a moving image coding method as set forth in claim 36, comprising the steps of:

a separation step of separating code data of an input frame into first code data corresponding to motion compensation target data and second code data corresponding to non motion compensation target data;

a first decoding step of generating decoded data of upper bits of each subband in a current frame on the basis of a difference value and motion vector information with respect to data of the upper bits of each subband in the current frame obtained by decoding the separated first code data and decoded data of motion compensation data in a preceding frame;

a second decoding step of decoding the second code data encoded by said second coding step to decode the bitplanes of the data of the lower TB bits that exclude the number of bitplanes, from a lowest bit plane, decided by said decision step, which detects the code data amount of the current frame multiplexed by said multiplexing step and decides a number of bitplanes not to be encoded for the subsequent frame, when the preceding frame had been encoded, TB representing a threshold set for the extraction of data of each subband;

a generation step of generating frequency component data of each subband in the current frame by combining the decoded data of the lower bits of each subband obtained in the second decoding step and the decoded data of the upper bits of each subband obtained in the first decoding step; and

a reconstruction step of reconstructing an image of the current frame by performing processing inverse to the decomposition step for the frequency component data of the subband generated in the generation step.

In claim 43:

43. A non-transitory computer-readable storage medium storing a computer program which is read and executed by a computer to function as a moving image decoding apparatus which decodes moving image data coded by a moving image coding apparatus as set forth in claim 31, wherein the computer program functions as:

separation means for separating code data of an input frame into first code data corresponding to motion compensation target data and second code data corresponding to non motion compensation target data;

first decoding means for generating decoded data of upper bits of each subband in a current frame on the basis of a difference value and motion vector information with respect to data of the upper bits of each subband in the current frame obtained by decoding the separated first code data and decoded data of motion compensation data in a preceding frame;

second decoding means for decoding the second code data encoded by said second coding unit to decode the bitplanes of the data of the lower TB bits that exclude the number of bitplanes, from a lowest bit plane, decided by said decision unit, which detects the code data amount of the current frame multiplexed by said multiplexing unit and decides a number of bitplanes not to be encoded for the subsequent frame, when the preceding frame had been encoded, TB representing a threshold set for the extraction of data of each subband;

generation means for generating frequency component data of each subband in the current frame by combining the decoded data of the lower bits of each subband obtained by the second decoding means and the decoded data of the upper bits of each subband obtained by the first decoding means; and

reconstruction means for reconstructing an image of the current frame by performing processing inverse to the decomposition unit for the frequency component data of the subband generated by the generation means.

Allowance

3. Claims 31, 32, 35-37, and 39-43 are allowed.
4. The following is an examiner's statement of reasons for allowance:

The present application comprises some of the elements of the claims, such as the following features, in combination with other recited limitations, which the closest prior art of record and the references cited in form PTO-1449 taken either singly or in combination does not teach or suggest:

- a) a decision unit that detects the code data amount of the current frame multiplexed by said multiplexing unit and decides a number of bitplanes not to be encoded for the subsequent frame; said second coding unit encodes bitplanes of data of the lower TB bits excluding the number of bitplanes, from a lowest bit plane, decided by said decision unit when the preceding frame had been encoded (independent claims 31 and 37).

- b) a deciding step of detecting the code data amount of the current frame multiplexed by the multiplexing step and deciding a number of bitplanes not to be encoded for the subsequent frame, wherein the second coding step encodes bitplanes of data of the lower TB bits excluding the number of bitplanes, from a lowest bit plane, decided by said deciding step when the preceding frame had been encoded (independent claim 36).
- c) second decoding means for decoding the second code data encoded by said second coding unit to decode the bitplanes of the data of the lower TB bits that exclude the number of bitplanes, from a lowest bit plane, decided by said decision unit, which detects the code data amount of the current frame multiplexed by said multiplexing unit and decides a number of bitplanes not to be encoded for the subsequent frame, when the preceding frame had been encoded (independent claims 39, 42, and 43).

5. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
